

CANTON NETWORK PROPOSAL

CanQuest

Growth Engine for the Canton Ecosystem on Canton Network

Strategic Proposal for Canton Network Ecosystem Partners

Canton Foundation Grants · Canton Ecosystem Directory · Build on Canton

June 2026

1. Executive Summary

CanQuest is a production-ready, Canton-native growth platform built to bring **real user activity and recurring fee revenue into the Canton Network** — by helping **other Canton projects acquire verified, active users**.

The product is designed for the core gap in Canton's growth: institutional infrastructure exists, but ecosystem projects still need a practical way to reach real users without being drained by bots and farms. CanQuest closes that gap by making verification structural rather than heuristic.

For Canton, CanQuest is strategically relevant because it advances three priorities aligned with network growth:

- It increases **real on-chain CC activity** — every user journey involves locking CC, transacting, and paying claim fees.
- It converts **external crypto users into Canton participants** through a familiar quest experience.
- It creates a **fee-based business model tied directly to network usage**, not short-term incentives.

CanQuest is not positioned as another generic quest platform. It is a **growth layer for the Canton ecosystem** — and it is built on a clear premise: **the activity is the product, not the reward**.

2. Why This Matters Now

Canton is becoming a high-value settlement and institutional blockchain network, but broad ecosystem adoption still needs practical user-facing products. Institutional infrastructure alone does not automatically create retail participation, developer activity, or everyday CC usage.

The ecosystem needs a layer that can:

- onboard real users into Canton through a familiar experience;
- give users a practical reason to hold, move, and use CC;
- help Canton projects distribute rewards to **verified participants, not farms**;
- generate measurable transaction activity and recurring application revenue.

CanQuest addresses exactly this gap. It turns Canton Coin activity into a growth channel — for the network and for every project building on it.

3. Strategic Fit with Canton

Canton's public strategy centers on growing network utilization, institutional adoption, and a thriving application ecosystem. CanQuest aligns with that mandate at the **application and user-acquisition layer**.

Where Canton supports the network from the protocol, treasury, and validator side, CanQuest supports it from the **user-activity side**:

- Canton provides the rails; CanQuest puts real users on them.
- Canton provides the assets (CC); CanQuest gives users a reason to lock, move, and use them.
- Canton provides the primitives (DAML, parties, CIP-0056); CanQuest turns them into a product people actually use.

The strategic thesis is simple:

CanQuest can become the user-facing growth and distribution layer for Canton — while generating usage-based fee revenue from real, verified activity.

4. Product Overview

CanQuest is a quest and reward platform built natively on the Canton Network. It provides a single surface for projects to run campaigns and for users to earn access through genuine activity.

Core capabilities:

- Commitment-based access (lock CC or burn earned points)
- Daily quest hub with server-verified tasks (social, quizzes, check-ins, on-chain transaction detection)
- Partner campaign engine (on-chain CC payouts, invite/access codes, waitlist slots, FCFS and raffle draws)
- Canton wallet (balance, send/receive/lock/unlock, invite-gated creation)
- Dashboard, transaction history with CantonScan integrity, leaderboard, and referrals
- Partner toolchain for campaign creation, reward inventory, winner draws, and on-chain distribution

To reach **Full access** and join partner campaigns, a user proves commitment through one of two paths:

- **Lock CC** — commit CC non-custodially from their own Canton wallet (entry at 30 CC, scalable higher). Returned in full at unlock.
- **Burn points** — active users who earn 5,000 points through quests can burn them to unlock access.

One Canton party = one verified identity. Either path requires real effort or capital, so farming becomes irrational.

5. Core Value Proposition

For Canton Network

CanQuest drives **utility-based activity**. Every lock, quest, claim, and transfer moves CC on-chain for a genuine reason. Critically, a holding fee applies while CC is locked — so **every CanQuest lock generates recurring fee revenue for the network** throughout the lock term.

For Canton Projects (Partners)

CanQuest is a ready-made growth channel. A project defines its tasks and rewards; CanQuest delivers **verified, active Canton users** — not passive airdrop claimants. Projects can launch campaigns in days, not months, without building their own anti-bot or reward infrastructure.

For Users

A familiar quest experience that rewards genuine participation. Users hold and use CC, complete tasks, compete on leaderboards, and earn access — while every action is recorded on-chain with full transparency.

For Canton as a Strategic Partner

A measurable, usage-tied contribution to ecosystem growth. CanQuest's revenue scales with real transaction volume, and its growth directly translates into more CC movement and more network fee income.

6. Revenue Model

CanQuest has a durable, usage-based revenue model — all denominated in CC, all on-chain, all auditable.

Claim Fees

Every reward claim carries a small CC fee, settled on-chain via Canton's transfer standard.

- Transaction revenue is tied to real campaign activity, not speculation.
- Fee logic is attached to genuine utility.

Transfer Fees

A platform fee on standard CC transfers between wallets.

- Revenue from everyday wallet usage.
- A simple recurring revenue layer.

Featured App Rewards

CanQuest participates in Canton's validator-side App Reward mechanism, earning CC proportional to genuine on-chain activity.

Partner Campaign Hosting

Partners pay to run campaigns on the platform — budget-for-rewards and featured placement.

Why the model is durable: Revenue scales with **real transaction volume**, not incentives. Every campaign launched, every claim processed, and every wallet action generates measurable CC movement on the Canton ledger.

7. Technical Differentiation

CanQuest's technical value is not the quest UI. The real differentiation is the **Canton-native infrastructure behind it** — using primitives that EVM chains cannot replicate.

Non-Custodial CC Locking

Participation is gated by Canton's native `LockedAmulet` primitive. The user's CC never leaves their wallet, yet the network earns a holding fee while it is locked. This turns commitment into both a Sybil-resistant signal and a network revenue source.

DAML-Enforced Reward Settlement

Campaign state, fee collection, reward delivery, and audit trails are enforced on-ledger via DAML smart contracts — not calculated on a front-end. Reward rules cannot be bypassed from the client.

CIP-0056 Transfers

Claim fees and reward payouts settle through Canton's standard transfer flow, with preapproval-based execution that respects receiver readiness.

Party-Based Identity

Each user is a real Canton party. This is what makes Sybil resistance structural: a bot cannot farm a campaign by cheaply replicating wallets, because it cannot cheaply replicate locked CC across verified parties.

Retention Loop

The two commitment paths are deliberately designed to keep users active. The **burn path** consumes points, pulling users back into daily quests to earn more — while CC keeps moving on-chain through repeated, genuine activity.

8. Why CanQuest Can Drive Adoption

CanQuest focuses on **utility-first adoption**.

Many onboarding strategies rely on campaigns, rewards, or temporary incentives. CanQuest is built around recurring, genuine actions:

- users lock CC because they want verified access;
- users complete quests because it earns them access and rank;
- users transact because the platform requires real on-chain activity;
- users return daily because streaks, points, and leaderboards reward consistency.

This makes CanQuest activity **more durable than incentive-only growth** — and fundamentally different from farming.

CanQuest's initial geographic advantage is **Indonesia and Southeast Asia**, where crypto participation is high but Canton-specific access remains early. A Canton-native growth platform can become a practical entry point for these users.

9. Strategic Impact for Canton Network

CanQuest contributes to the Canton ecosystem in four direct ways.

User Onboarding

A familiar entry point into Canton for crypto-native users — without forcing them to understand Canton internals first.

CC Movement

Every campaign, lock, claim, transfer, and daily quest moves CC on-chain for a real reason — directly growing network utilization.

Network Revenue

Because locked CC accrues a holding fee, CanQuest user growth translates into recurring fee income for Canton itself.

Application-Layer Distribution

CanQuest becomes a reusable growth and distribution layer that any Canton project can plug into to reach verified users.

10. Competitive Positioning

CanQuest is positioned at the intersection of three categories:

- a **quest and rewards platform**;
- a **Sybil-resistant user-acquisition channel**;
- a **Canton-native growth layer**.

Most quest platforms are generic, chain-agnostic, and farm-prone. Most user-acquisition tools rely on heuristic anti-bot checks. Most institutional Canton infrastructure is not designed for everyday user onboarding.

CanQuest combines these into one product:

- Canton-native DAML, `LockedAmulet`, and CIP-0056 integration;
- structural Sybil resistance through party-based identity + commitment;
- a fee-generating, retention-driven activity loop;
- production-ready mainnet infrastructure.

This creates a clear strategic role: **CanQuest is not a quest platform with Canton support — it is a Canton growth engine that uses quests as the interface.**

11. Current Status

CanQuest is **mainnet-deployed and internally validated**.

Current readiness includes:

- mainnet deployment (not a testnet);
- full product flow exercised by the core team with real CC and real party identities;
- wallet creation, CC locking, daily quests, on-chain reward claims, and DAML audit trails;
- partner campaign creation and reward distribution;
- transaction history with CantonScan integrity;
- multiple internal security reviews completed.

Pre-public-launch. CanQuest currently runs as a controlled mainnet pilot. The Canton ecosystem support requested here is specifically to fund and de-risk the **first public user cohort** and the initial partner campaigns.

Product demonstrations

The following short videos show the platform in action. Each is 1–2 minutes, focused on one flow.

- **CC Lock & Full Access** — locking CC (or burning points) and reaching Full access.

LINK: <paste your video link here>

- **Reward Claim** — paying the CC claim fee on-chain and receiving the reward.

LINK: <paste your video link here>

- **Transaction History** — on-chain integrity with CantonScan explorer links.

LINK: <paste your video link here>

- **Quest & Earn Hub** — daily task completion and campaign participation.

LINK: <paste your video link here>

- **Wallet & Dashboard** — balance, send/receive/lock, and activity overview.

12. Go-To-Market Strategy

Phase 1: Canton User Activation (Months 0–3)

Activate the first cohort of CC holders, run the first partner campaigns, and validate unit economics on mainnet.

- Wallet onboarding; CC lock and quest activity; first partner campaigns.

Phase 2: Southeast Asia Expansion (Months 3–9)

Scale community acquisition in Indonesia and Southeast Asia, and expand the partner campaign pipeline.

- Localized onboarding; partner integrations; community growth.

Phase 3: Ecosystem Distribution Layer (Months 9–18)

Position CanQuest as the default verified-growth infrastructure for Canton, with self-serve partner tooling and deeper integrations.

- Self-serve campaigns; API/embedded integrations; ecosystem partnerships.

13. Key Metrics to Track

CanQuest should be evaluated by usage, revenue, and Canton ecosystem impact.

- Commitments created (CC locks + points burns)

- Total CC locked (non-custodial)
- Active Canton parties
- On-chain CC transfer volume
- Claim fee revenue (CC)
- Partner campaigns hosted
- Monthly active verified users
- Repeat transaction rate

These metrics directly reflect **Canton Network utilization** — the outcomes the ecosystem wants to grow.

14. Risk and Mitigation

Technical Complexity

Canton transactions involve party authorization, preapproval, and ledger-level settlement.

Mitigation: Canton-aware backend logic, DAML-enforced fee/reward settlement, preapproval checks, and production configuration. Multiple internal security reviews completed; external DAML audit planned for production hardening.

User Onboarding Friction

Canton-specific concepts can be difficult for new users.

Mitigation: CanQuest hides complexity behind familiar quest and wallet flows, with guided onboarding and status indicators. Users never interact with raw Canton internals.

Reward-System Abuse

Reward products are inherently exposed to farming and exploitation attempts.

Mitigation: Commitment is required *before* any reward (CC lock or points burn), identity is one Canton party per verified human, and all settlement is DAML-enforced on-ledger. This makes farming economically irrational — the structural core of CanQuest's design.

Regulatory and Operational Requirements

Reward and fee products require careful operational controls.

Mitigation: Invite-gated onboarding, user moderation with session revocation, full on-ledger audit trails, CantonScan transparency, and admin-managed compliance controls.

15. Investment Thesis

CanQuest is a practical way to increase Canton usage from the application layer — while directly serving the growth of every other Canton project.

The product is already mainnet-deployed, has a clear fee model, and targets users who need real transaction utility. It helps Canton expand the ecosystem beyond institutional infrastructure by supporting a user-facing product that drives **activity, volume, and recurring network revenue**.

The strongest case for supporting CanQuest is not that it is a quest platform. The strongest case is that CanQuest is a **monetized Canton growth engine**.

- It turns external users into **active Canton users**.
- It turns quests and rewards into **verified on-chain activity**.
- It turns CC locks into **recurring fee revenue for the network**.
- It turns every partner campaign into **ecosystem growth**.

16. Proposed Strategic Partnership

CanQuest is open to closer involvement with Canton — to strengthen production operations and scale verified activity across the ecosystem.

Potential areas of collaboration:

- Canton Ecosystem Directory listing and visibility;
- technical and network advisory support;
- partner introductions for pilot campaigns;
- co-marketing for Canton user acquisition.

The objective is to make CanQuest one of the practical user-growth gateways into Canton Network activity.
