

CANQUEST · CANTON NETWORK

The growth layer for the Canton ecosystem

A Canton-native quest & wallet platform — verified users, real on-chain activity,
and recurring network revenue.

Investor pitch · July 2026 · canquest.cc

THE PROBLEM

Canton has the rails. It still lacks real users.

Institutional infrastructure exists, but ecosystem projects still can't reach genuine participants without being drained by bots and farms.

- **Generic quest platforms are farm-prone — rewards leak to bots, not real users.**
- **Heuristic anti-bot checks are weak — sybils replicate wallets cheaply.**
- **Institutional Canton infra doesn't create everyday CC usage or retail participation.**
- **Projects launching on Canton need a practical, verified growth channel.**

THE SOLUTION

CanQuest: structural verification, not heuristics.

One verified human = one Canton wallet. Real activity — locking CC, transacting, swapping — is the Sybil signal itself.

1 Verified identity

Google sign-up, one wallet per human via invite-gated party ID, email OTP.

2 On-chain commitment

Lock CC non-custodially to reach Full access and unlock partner campaigns.

3 Real activity loop

Quests, on-chain sends/swaps, and campaigns that move CC for a real reason.

WHAT THE PRODUCT DOES

Six menus, one verified account.

A complete Canton-native dapp — wallet, quests, partner campaigns, leaderboard, and swap — all in production today.

- **Overview**

Dashboard: profile, CC holdings, net points, activity stats.

- **Earn**

Partner campaigns with CC, invite codes, waitlist slots.

- **Quests**

Daily & on-chain tasks (send, swap, lock) that earn points.

- **Wallet**

Canton party ID: send, receive, swap, lock, offers.

- **Leaderboard**

Weekly / monthly / all-time ranking by net points.

- **Settings**

Wallet password, one-step transfer, X connection.

Where CC moves — for a reason.

A real Canton party ID per user, with full send / receive / swap / lock flows settling on-ledger.

Wallet capabilities

- Send CC or tokens by @username or Canton party ID.
- Receive via QR code; accept/reject incoming offers; cancel outgoing.
- Lock 30 CC (non-custodial) to reach Full access.
- Full transaction history with Canton explorer links.

Swap (Cantex)

- Swap CC ↔ USDCX through the Cantex DEX, on-network.
- Live quote: rate, price impact, applicable network cost.
- Auto-refund on timeout; failed deliveries tracked.
- More pairs (CBTC and others) coming soon.

Verified growth for Canton projects.

Projects launch campaigns; CanQuest delivers verified, active early users — and rewards settle on-chain.

- **CC rewards**
First-come or raffle-drawn CC payouts, settled to the user's wallet.

- **Invite / access codes**
Early entry to partner apps, testnets, or whitelists.

- **Waitlist spots**
Raffle or FCFS slots for launches and drops.

- **CC + code combos**
Combined CC and code rewards in a single draw.

Each campaign sets its own access gate — free, a CC lock, points, or either. Tasks are social (follow, join) and server-verified; draws use secure randomness.

Verification is structural, not heuristic.

Farming becomes economically irrational — the cost of faking a participant exceeds the reward.

- **One party ID per human** — invite-gated wallet creation under a daily quota.
- **Google sign-up + email OTP** — real identity signals at account creation.
- **CC commitment** — Full access requires locking real CC, returned in full.
- **Server-verified tasks** — points and draws decided on the server with audit trails.
- **Referral anti-farm** — rewards require verified email + connected X; self-referrals and alias farming blocked.

Usage-based revenue, all on-chain.

Revenue scales with real transaction volume — every lock, claim, send, and swap moves CC on-network.

1

Campaign claim fees
Reward claims carry a CC cost settled on-chain — tied to genuine campaign activity.

2

Transfer fees
A platform cost on CC and token sends — recurring revenue from everyday wallet use.

3

Swap fees
A network cost (to the Cantex trading account) plus an optional platform cost per swap.

4

Holding fee
A network cost while CC is locked — recurring revenue throughout the lock term.

All revenue is denominated in CC, settled on-ledger, and auditable. Specific amounts are configurable and not published publicly.

STATUS

Mainnet-deployed and internally validated.

The full product flow runs on Canton mainnet with real CC and real party identities.

- Mainnet deployment (not a testnet) — wallet, quests, campaigns, swap, leaderboard.
- Full flow exercised by the core team with real CC and real Canton party identities.
- On-chain audit trails and CantonScan explorer links on every transaction.
- Now preparing the first public user cohort and initial partner campaigns.

Indonesia & Southeast Asia first.

A Canton-native growth platform can become the practical entry point for a high crypto-participation region.

1 Phase 1 — Activate

Onboard first CC holders; run initial partner campaigns; validate unit economics on mainnet.

2 Phase 2 — Expand

Scale community acquisition across SEA; broaden the partner campaign pipeline; localize onboarding.

3 Phase 3 — Distribution layer

Self-serve partner tooling and ecosystem integrations — the default growth layer for Canton.

WHY CANQUEST, WHY NOW

A monetized Canton growth engine.

Canton needs user-facing products. CanQuest turns real activity into network revenue — and helps every other Canton project grow.

- Turns external users into active Canton participants.
- Turns quests and rewards into verified on-chain activity.
- Turns CC locks into recurring fee revenue for the network.
- Turns every partner campaign into ecosystem growth.

Let's build the growth layer for Canton together.
