

CANQUEST · CANTON NETWORK

The growth layer for the Canton ecosystem

A Canton-native quest & wallet platform — verified users,
real on-chain activity, and recurring network revenue.

Investor pitch · July 2026 · canquest.cc

THE PROBLEM

Canton has the rails. It still lacks real users.

Institutional infrastructure is live — but ecosystem projects can't reach genuine participants without being drained by bots and farms.

1 Farm-prone quests

Generic platforms leak rewards to bots, not real users.

2 Weak anti-sybil

Heuristic checks are gamed; sybils replicate wallets cheaply.

3 No retail surface

Institutional infra doesn't create everyday CC usage.

HOW IT WORKS

Verification is structural, not heuristic.

One verified human = one Canton wallet. Real on-chain activity is the anti-sybil signal itself.

THE PRODUCT

Six menus, one verified account.

A complete Canton-native dapp in production today.

01 Overview

Profile, CC holdings, net points, activity.

02 Earn

Partner campaigns: CC, codes, waitlist.

03 Quests

Daily & on-chain tasks → points.

04 Wallet

Send, receive, swap, lock CC.

05 Leaderboard

Rank by net points.

06 Settings

Wallet password, one-step transfer, X.

Where CC moves — for a reason.

A real Canton party ID per user, with full send / receive / swap / lock flows settling on-ledger.

Wallet

- Send CC or tokens by @username or party ID.
- Receive via QR; accept/reject offers; cancel outgoing.
- Lock 30 CC (non-custodial) → Full access.
- Full history with Canton explorer links.

Swap (Cantex)

- Swap CC ↔ USDCX through the Cantex DEX.
- Live quote: rate, price impact, network cost.
- Auto-refund on timeout; deliveries tracked.
- More pairs (CBTC + others) coming soon.

Verified growth for Canton projects.

Projects launch campaigns; CanQuest delivers verified early users. Rewards settle on-chain.

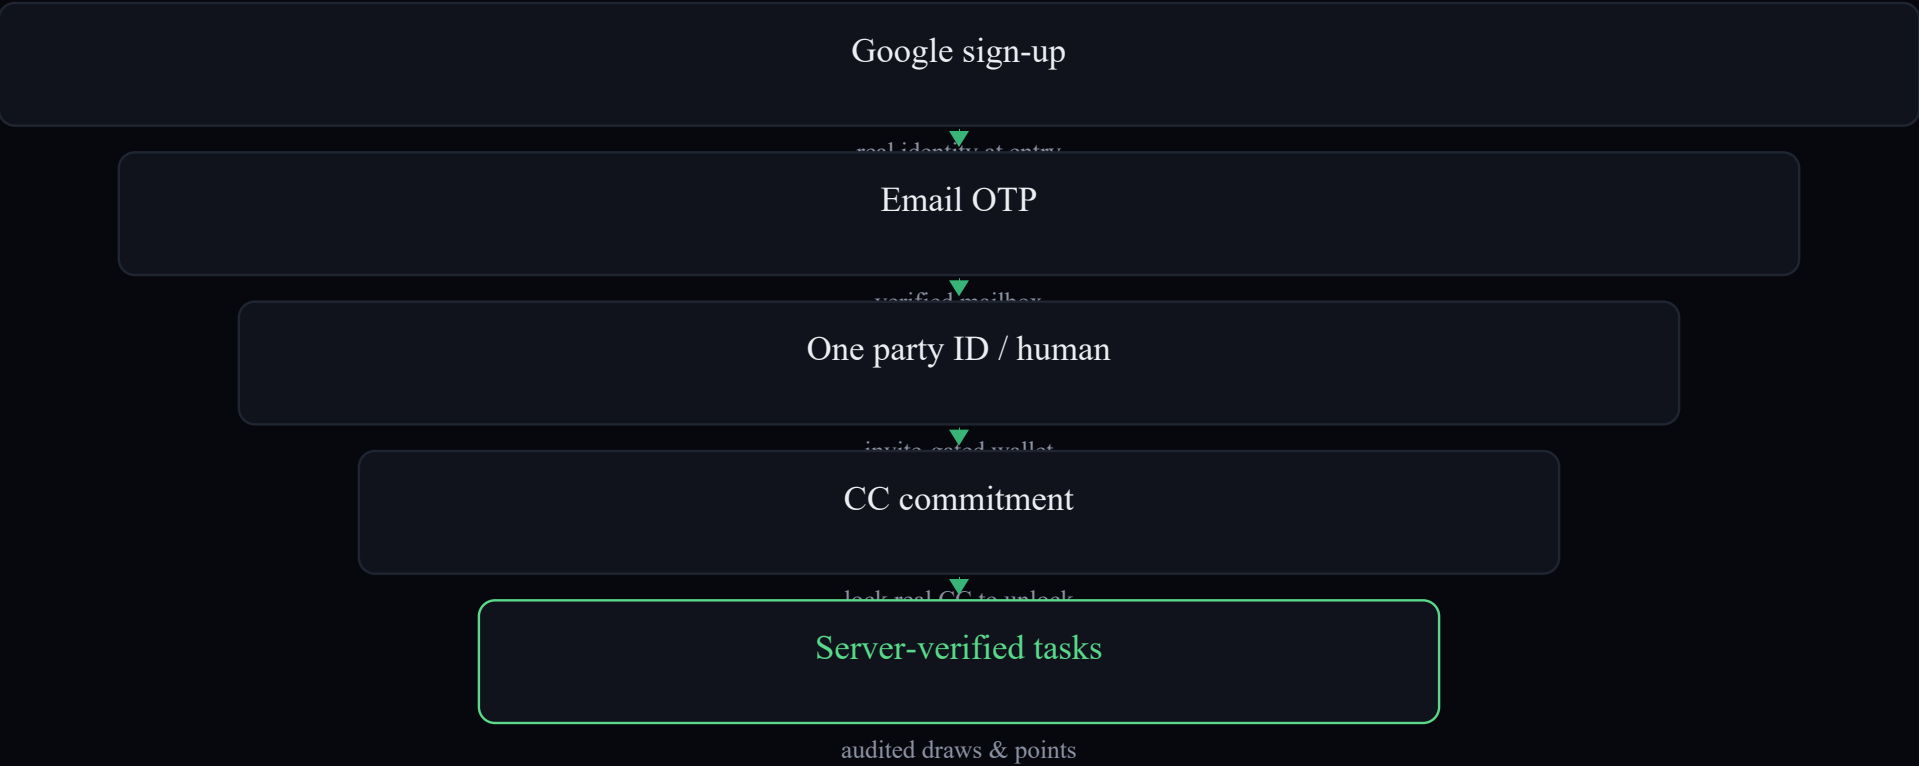

• CC FCFS First-come CC payouts.	• CC Raffle Drawn CC winners.	• Waitlist FCFS First-come invite/access codes.
• Waitlist Raffle Drawn codes.	• Waitlist Email Email raffle entry.	• CC + Code Combined CC & code draw.

Access gates are set per campaign — free, a CC lock, points, or either. Tasks are social and server-verified; draws use secure randomness.

WHY IT CAN'T BE FARMED

Each layer narrows the funnel.

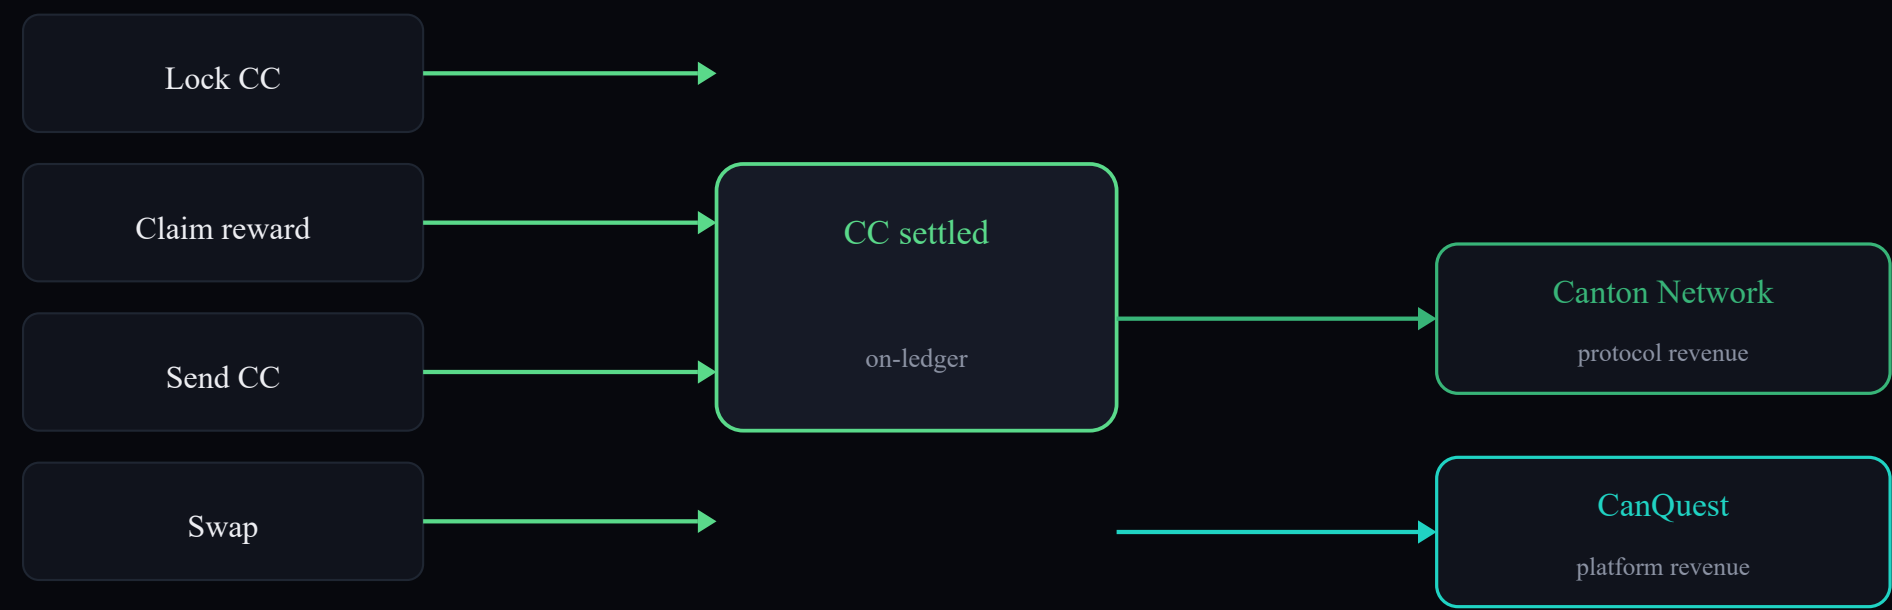

Farming becomes economically irrational — faking a participant costs more than the reward.

BUSINESS MODEL

Usage-based revenue, all on-chain.

Every lock, claim, send, and swap moves CC on-network. Revenue scales with real volume.

All revenue is denominated in CC, settled on-ledger, and auditable. Specific amounts are configurable and not published publicly.

STATUS

Mainnet-deployed and internally validated.

Full product flow runs on Canton mainnet with real CC and real party identities.

Let's build the growth layer for Canton together.
